Applying load to the motor will change not only all the phase relations, but also the amplitude of the current. Fig. 59 is designed to show the result of loading the motor when its excitation is such as to produce a lagging current at no load. The energy transformed by the motor into mechanical work is: $P_2 = I_e \cos \phi_2$. As the load comes on the armature of the motor is held back so as to increase the lag of $O E_v$ while $O E_s$ Z_{m1} increases until the above equation for P_2 is fulfilled. It will be seen that increasing the load may bring the current into phase with the impressed E. M. F. A similar action takes place if the motor excitation is such as to produce a leading current at no load. This is shown in Fig. 60. Experiment ix. --External Characteristic of an Alternator at Constant Power Factor, (a) Leading Current. (b) Lagging Current. In this experiment the object is to show the effect of the phase of the current upon the armature reaction. The leading and lagging currents are obtained by varying the excitation and the load of a synchronous motor. In connecting machines in parallel, where a synchronizer is not available, lamps are ordinarily used. Fig. 61 shows the arrangement for a single-phase single-pole switch. A doublepole switch should have one of the lamps across each break, the rated voltage of each lamp being that of the...
